

The graph highlights both external and internal dependencies in the Grad Cafe project. External libraries like Flask and psycpg are used in the application code. Flask is a dependency for both `src.app` and `src.app.pages`, while psycpg is used within `src.load_data`. The internal structure shows that all modules are organized under the `src` package. Within `src`, the `src.app` module depends on `src.app.pages`. Additionally, `src.load_data` connects to both `src.app.pages` and `run.py`, providing data-loading functionality across multiple parts of the application. Overall, the graph shows that `run.py` serves as the central orchestrator, with `src.app` and `src.load_data` as the main modules and external dependencies integrated where needed.
